ICD-10 Clinical Concepts for Family Practice is a feature of Road to 10, a CMS online tool built with physician input.

With Road to 10, you can:

- Build an ICD-10 action plan customized for your practice
- Use interactive case studies to see how your coding selections compare with your peers' coding
- Access quick references from CMS and medical and trade associations
- View in-depth webcasts for and by medical professionals

To get on the Road to 10 and find out more about ICD-10, visit:

ICD-10 Compliance Date: October 1, 2015
Specifying anatomical location and laterality required by ICD-10 is easier than you think. This detail reflects how physicians and clinicians communicate and to what they pay attention - it is a matter of ensuring the information is captured in your documentation.

In ICD-10-CM, there are three main categories of changes:

- Definition Changes
- Terminology Differences
- Increased Specificity

Over 1/3 of the expansion of ICD-10 codes is due to the addition of laterality (left, right, bilateral). Physicians and other clinicians likely already note the side when evaluating the clinically pertinent anatomical site(s).

HYPERTENSION

Definition Change

In ICD-10, hypertension is defined as essential (primary). The concept of “benign or malignant” as it relates to hypertension no longer exists.

When documenting hypertension, include the following:

1. Type  
   e.g. essential, secondary, etc.
2. Causal relationship  
   e.g. Renal, pulmonary, etc.

ICD-10 Code Examples

<table>
<thead>
<tr>
<th>Code</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>I10</td>
<td>Essential (primary) hypertension</td>
</tr>
<tr>
<td>I11.9</td>
<td>Hypertensive heart disease without heart failure</td>
</tr>
<tr>
<td>I15.0</td>
<td>Renovascular hypertension</td>
</tr>
</tbody>
</table>
ASTHMA

Terminology Difference

ICD-10 terminology used to describe asthma has been updated to reflect the current clinical classification system.

When documenting asthma, include the following:

1. **Cause**
   - Exercise induced, cough variant, related to smoking, chemical or particulate cause, occupational

2. **Severity**
   - Choose one of the three options below for persistent asthma patients
     1. Mild persistent
     2. Moderate persistent
     3. Severe persistent

3. **Temporal Factors**
   - Acute, chronic, intermittent, persistent, status asthmaticus, acute exacerbation

**ICD-10 Code Examples**

- J45.30 Mild persistent asthma, uncomplicated
- J45.991 Cough variant asthma

UNDERDOSSING

Terminology Difference

Underdosing is an important new concept and term in ICD-10. It allows you to identify when a patient is taking less of a medication than is prescribed.

When documenting underdosing, include the following:

1. **Intentional, Unintentional, Non-compliance**
   - Is the underdosing deliberate? (e.g., patient refusal)

2. **Reason**
   - Why is the patient not taking the medication? (e.g., financial hardship, age-related debility)

**ICD-10 Code Examples**

- Z91.120 Patient’s intentional underdosing of medication regimen due to financial hardship
- T36.4x6A Underdosing of tetracyclines, initial encounter
- T45.526D Underdosing of antithrombotic drugs, subsequent encounter
ABDOMINAL PAIN AND TENDERNESS

Increased Specificity

When documenting abdominal pain, include the following:

1. **Location**
   e.g. Generalized, Right upper quadrant, periumbilical, etc.

2. **Pain or tenderness type**
   e.g. Colic, tenderness, rebound

**ICD-10 Code Examples**

- R10.31  Right lower quadrant pain
- R10.32  Left lower quadrant pain
- R10.33  Periumbilical pain

DIABETES MELLITUS, HYPOGLYCEMIA AND HYPERGLYCEMIA

Increased Specificity

The diabetes mellitus codes are combination codes that include the type of diabetes mellitus, the body system affected, and the complications affecting that body system.

When documenting diabetes, include the following:

1. **Type**
   e.g. Type 1 or Type 2 disease, drug or chemical induced, due to underlying condition, gestational

2. **Complications**
   What (if any) other body systems are affected by the diabetes condition? e.g. Foot ulcer related to diabetes mellitus

3. **Treatment**
   Is the patient on insulin?

A second important change is the concept of "hypoglycemia" and "hyperglycemia." It is now possible to document and code for these conditions without using "diabetes mellitus." You can also specify if the condition is due to a procedure or other cause.

The final important change is that the concept of "secondary diabetes mellitus" is no longer used; instead, there are specific secondary options.

**ICD-10 Code Examples**

- E08.65  Diabetes mellitus due to underlying condition with hyperglycemia
- E09.01  Drug or chemical induced diabetes mellitus with hyperosmolarity with coma
- R73.9   Transient post-procedural hyperglycemia
- R79.9   Hyperglycemia, unspecified
INJURIES

Increased Specificity

ICD-9 used separate “E codes” to record external causes of injury. ICD-10 better incorporates these codes and expands sections on poisonings and toxins.

When documenting injuries, include the following:

1. Episode of Care e.g. Initial, subsequent, sequelae
2. Injury site Be as specific as possible
3. Etiology How was the injury sustained (e.g. sports, motor vehicle crash, pedestrian, slip and fall, environmental exposure, etc.)?
4. Place of Occurrence e.g. School, work, etc.

Initial encounters may also require, where appropriate:

1. Intent e.g. Unintentional or accidental, self-harm, etc.
2. Status e.g. Civilian, military, etc.

ICD-10 Code Examples

Example 1:
A left knee strain injury that occurred on a private recreational playground when a child landed incorrectly from a trampoline:

• Injury: S86.812A, Strain of other muscle(s) and tendon(s) at lower leg level, left leg, initial encounter
• External cause: W09.8xA, Fall on or from other playground equipment, initial encounter
• Place of occurrence: Y92.838, Other recreation area as the place of occurrence of the external cause
• Activity: Y93.44, Activities involving rhythmic movement, trampoline jumping

Example 2:
On October 31st, Kelly was seen in the ER for shoulder pain and X-rays indicated there was a fracture of the right clavicle, shaft. She returned three months later with complaints of continuing pain. X-rays indicated a nonunion. The second encounter for the right clavicle fracture is coded as S42.021K, Displaced fracture of the shaft of right clavicle, subsequent for fracture with nonunion.
